

RAG Format Fidelity Observatory Manual

Fixture format: PDF. This label is not part of the answer key.

Identity and access

The facility is named **Aurora Finch Observatory**. Its active access phrase is **VIOLET-7291**.

The phrase **CRIMSON-4180** is retired and must not be used. It is included only to test whether retrieval preserves negation and status.

Sensor limits

Sensor	Emergency threshold	Calibration interval
North-17	37.4 degrees Celsius	43 days
South-08	41.2 degrees Celsius	28 days

Emergency procedure

When North-17 exceeds 37.4 degrees Celsius, Mira Solano authorizes the emergency shutdown. The shutdown decision must be recorded within 11 minutes of the alarm.

The table values and this procedure are authoritative. A nearby training note that mentions a 15-minute drill does not replace the 11-minute production deadline.

Cross-page continuity

The backup calibration capsule is stored in locker

K-204. The locker identifier must remain attached to the phrase "backup calibration capsule" even when a page boundary separates nearby paragraphs.

Deliberate omissions

This manual does not state a launch mass, launch date, orbital altitude, or fuel capacity. A system using this document must not invent those values.
